

Every data point points to the same gap: People know who they're gifting, they just can't decide what

Survey Insights

- **53% report high gifting anxiety** (score 4–5 out of 5).
- **~58% spend 3+ hours per occasion** or give up and buy a gift card.
- **86% say top-10 gift lists fail** because "they don't know the specific personality of the person" (#1 reason by far — 18 out of 22 respondents)
- **34% ask a mutual friend for a safe idea** — the most common go-to move (Only 10% Google for gifts — people want judgment, not search).
- **"Reflects knowledge of person's interests" tied #1 in priority ranking** (avg 4/5) Monetary value ranked dead last (avg 2.76/5) — it's never about the price!
- **95% open to AI help** (38% Yes + 57% Maybe) Top trust signal: 71% want it to "ask detailed questions about the person, not just the occasion"

User Persona 1

Aditi, 27

Status: Software Engineer

Location: Mumbai

Anxiety Level : 4/5

Browsing Behavior: Spends 3-10 hours or multiple days

Needs:

- **A structured way to think** about who her friend is before searching for what to buy.
- Wants to **feel confident** about it.

Pain Points:

- Opens gift websites and feels more lost — **so many options**.
- Ends up buying a **"safe option"**.

Occasion: Best friend's birthday

"I know her so well but still confused what to gift. Why is it so hard?"

User Persona 2

Anshuman, 30

Status: Founder

Location: Bengaluru

Anxiety Level : 5/5

Browsing Behavior: Asks a mutual friend first.

Needs:

- The gift **needs to signal effort** especially for professional relationships
- Wants to understand **why a gift fits** this person.

Pain Points:

- Every list he finds feels like an ad — **no personality factor**.
- Too personal feels awkward, too generic feels lazy.

Occasion: Colleague's Farewell

"I don't even know where to start, it can't be too formal, can't be too casual. What does he even like?"

The decision gap in gifting is real, validated, and unsolved until now

True Problem

The barrier to confident gifting is not product availability. People aren't missing products but a frame. Every current tool starts at product discovery and skips the harder question entirely: what kind of gift fits this person, right now?

Target Segment

Young urban professionals (22–35 years old) who'd rather spend 3 hours deciding than send something that feels lazy. They have high decision anxiety.

How Do We Know This Is A Problem?

- **86% say gift lists fail** because they don't know the recipient's personality (survey, n=21)
- **48% spend 3+ hours** or give up entirely (survey, n=21)
- **33% ask a human (a mutual friend)** when stuck. Not Google. Not Amazon. A person. (survey)
- **\$10.1B wasted on unwanted gifts annually** in the US alone

Value Generated by Solving This Problem?

For Users

- Structured thinking about recipient before any product appears.
- From 3+ hrs of aimless browsing to a clear direction.
- Gift feels personal and not like they took the easy way out.

For Business

- High retention – Gifting recurs 8–12x/year.
- Users who tie identity to thoughtfulness will pay to protect it.
- Every session builds a richer recipient profile.

Why Solve This Now?

- LLMs can now interpret personality signals, relationship context, and emotional depth.
- India's online personalized gifting market is growing at **3.1% CAGR with \$841.5M SAM in 2026**.
- 95% of survey respondents are open to AI help.
- Post-pandemic, people became more intentional about relationships. Gifting frequency and emotional investment both rose after 2020.

One core problem needs one focused solution — I chose depth over breadth

Occasion Context Layer

What is it?

Detects relationship type + occasion + social context to filter what's appropriate

How does it work?

Detects the social stakes of the occasion — professional vs personal, close vs new relationship, celebratory vs consoling. Filters gift directions accordingly so that the user never gets the same output.

Solves: Anshuman's pain point (professional gifting has no playbook).

Desirability	3/5
Usability	5/5
Impact	3/5
Viability	4/5

Total Score : 15/20

Recipient Intelligence Engine

What is it?

AI builds a personality + life context profile of the recipient through structured questions, outputs themed gift directions with reasoning

How does it work?

Personality-driven questions → behavioral profile → named gift directions with reasoning. No products surfaced unless user chooses to explore.

Solves: decision anxiety, generic list problem, "I know them but can't decide" gap.

Desirability	5/5
Usability	4/5
Impact	5/5
Viability	5/5

Total Score : 19/20

Gift Memory Vault

What is it?

Saves past gifts given, tracks what landed well, builds a history per relationship.

How does it work?

Stores every gifting session per recipient. Tracks what direction was chosen, what was bought, whether it landed well. Builds a relationship gifting history that gets smarter over time.

Solves: repeat gifting anxiety — "I already got her something similar last year".

Desirability	3/5
Usability	3/5
Impact	2/5
Viability	3/5

Total Score : 11/20

Unwrap guides us from 'I don't know' to a confident gift direction in under 5 minutes

Landing Page

Stop browsing. Start understanding.

Form

Recipient, relationship, occasion, budget (context before questions).

Quiz

Questions about the person, not the occasion(personality-first).

Output

3 named gift directions with reasoning (no product list, no generic suggestions).

Unwrap is a lightweight AI layer sitting between human knowledge and confident decisions

We measure what matters — confidence, not clicks

Success Metrics

L1 Metrics (primary actions)

Metric	Formula
Quiz completion rate	$\text{Sessions reaching output} \div \text{sessions started}$
Direction engagement	$\text{Users expanding } \geq 1 \text{ direction} \div \text{total outputs}$
Start over rate	$\text{Sessions restarted} \div \text{total sessions}$

L2 Metrics (outcome signals)

Metric	Formula
Output share rate	$\text{Users who click share} \div \text{total outputs generated}$
Referral rate	$\text{Sessions from shared link} \div \text{total sessions}$
Premium conversion	$\text{Paid sessions} \div \text{total deep dive starts}$

Guadrail Metrics (Failure signs)

Metric	Formula
Question Fatigue	$\text{Avg. time per question} / \text{Drop-off at Q7+}$
Genericity Score	$\% \text{ of users marking output as "Too Generic"}$

Monetisation Plan

Free Tier

- Quick mode (6 Qs) — unlimited
- The first session is zero commitment.

Deep Dive Tier

- 15 questions + full profile + card notes.
- ₹49/session.
- Targets high-stakes occasions.

Unwrap Pro

- Unlimited deep dives + saved profiles.
- ₹199/month
- Worth it for 8–12 occasions/year.

Win the first 10,000 users through trust, not ads — and know exactly what could go wrong

How We Get Our First 10,000 Users (Distribution Model)

- **Referral loop (Primary)**

"I used this to find your gift" — shareable gift direction cards that the giver sends to the recipient (creates virality). Easy to screenshot and share. The recipient becomes the next user.

- **College communities +WhatsApp groups**

Seed in 5–10 college communities personally. Offer free deep dives for early feedback.

- **Instagram / social media**

Founder-led content. Short-form content showing "I spent 3 hours on Amazon vs 5 minutes on Unwrap."

- **Corporate gifting partnerships (Post-MVP)**

After 1,000 consumer users, approach 2–3 startups directly with a team plan offer.

What Could Make This Fail (Risk Factors and Mitigation)

- **AI output feels generic despite deep questions**

Mitigation: Every direction must reference specific answers from the quiz in its reasoning. Building a feedback loop (rate this output 1–5) and use low scores to retrain prompts.

- **Low repeat usage**

Users may come once, get a direction, and never return.

Mitigation: Occasion reminders — ask users to save upcoming gifting dates. Send a nudge 2 weeks before. The product needs to insert itself into the gifting calendar.

- **Hard to defend against a well-resourced competitor**

Amazon, Flipkart, or a funded startup could replicate the quiz flow in weeks.

Mitigation: Moat is data + trust. Every session builds a richer understanding of how personality signals map to gift confidence. The more sessions, the better the prompt calibration. A new entrant starts with zero of this.
