

Flam Quest / Sticky Scan

Author: Paridhi Talwar, Product Manager

Status: In Review

Last Updated: July 13, 2026

Target Release: Single-brand pilot, then cross-brand expansion

1. Overview

Flam is great at grabbing attention for fifteen seconds, but we lose people the moment the AR ends. We're great at the "wow," but we're missing the "what's next."

Flam Quest fixes this by adding a simple rewards layer directly in the browser. No apps, no friction. Users scan, collect stamps, and win stuff. It turns a one-off ad into a reason to keep looking for the next QR code.

The business case is simple: right now, Flam can tell a brand how many people watched their AR experience. With Flam Quest, Flam can tell a brand how many people came back.

2. Problem Statement

Currently, Flam's "no-app" approach is one of its best feature, but it's also why nobody stays.

- **Current Behavior:** A user sees a QR code -> Scans it -> Watches the 15-second AR ad -> Closes the browser tab.
- **The Pain:** There is zero gravity pulling them back. We're paying for the first scan but getting no long-term value from it because there's no habit being formed.
- **The Reality:** People like the "wow" factor, but they don't have a reason to do it twice. We need a hook that makes the second scan feel necessary.

The missing piece isn't a better AR experience. It's a reason to scan again.

3. Target Audience & Segmentation

Flam Quest has to work for three different audiences at once — the mechanic only succeeds if all three see value:

Segment	What they need from this
End users	Young, mobile-first scanners (e.g. college students) who are already scanning for the AR moment. They need the reward to feel like a bonus on top of something they were already doing, not a new task.
Brands	FMCG / packaged-goods brands running AR campaigns today. They need a way to justify repeat spend beyond one-time impressions, a lever for cross-sell and time-in-campaign, not just view counts.
Flam (platform)	Needs a retention metric it can point to in sales conversations, and a new packaged product (cross-brand campaigns) it can sell on top of existing infrastructure.

The primary user persona anchoring the design is below — this is who the mechanic is built for first.

4. User Journey

Persona: Rohan, 22, college student.

1. Discovery: Rohan buys a bag of chips. The pack has a QR code: "Scan to Win a Movie Ticket."
2. The hook: He scans it. The AR plays. A subtle bar appears below: "Stamp 1 of 3 collected." He didn't have to do anything extra. The stamp came with the scan.
3. The motivation: The wallet tells him: "Scan a Coke can and get Stamp #2."
4. The hunt: Rohan actively searches for a Coke, not because he was thirsty, but because he is 1 stamp away from a movie ticket. This is the moment Flam becomes a sales channel, not just an awareness channel.
5. Reward: Once all 3 are collected, a unique coupon code is instantly generated in his browser. "You won a Movie Ticket!"

5. The Solution: Flam Quest

Flam Quest is a persistent, browser-based "Digital Passport" that rewards users for scanning multiple brands. It gamifies the consumption of AR ads. Each scan both plays the AR and awards a stamp. Stamps are collected toward brand or cross-brand rewards.

5.1 How it works

Instead of just showing an AR experience, every Flam scan now triggers two actions:

6. The content: The AR experience plays as usual.
7. The reward: A simple alert pops up: *"Nice! You just got a stamp. 2 more and the next Coke is on us."*

The key design constraint: the stamp mechanic cannot interrupt or compete with the AR experience. It appears after, not during.

5.2 Key features

- The Quest Engine: Brands configure stamp-based streaks through Flam's existing dashboard. A brand can run a solo campaign (scan 3 of our products, win a reward) or opt into cross-brand campaigns that Flam packages and sells.
- The Wallet: A small icon in the corner of the Web AR view opens the user's stamp collection. Phone-number OTP login ties progress to the user across sessions and devices. "Your Flam Passport — 3/5 stamps to unlock a reward."
- Cross-Brand Partnerships: This is a new revenue stream. This lets us sell across brands. "Scan a snack and a drink to win a movie ticket." We handle the logic; they just join the campaign.

5.3 Strategic value

Stakeholder	Value proposition
For users	Turns passive ad-watching into an active, rewarding game.
For brands	Increases time-in-app and provides a powerful tool for cross-selling.

Stakeholder	Value proposition
For Flam	Solves the retention problem.

6. Market Validation & Competitive Benchmarks

- Tetra Pak (Connected Packaging): Sells "Scan & Win" modules explicitly to dairy brands, citing a 28% sales uplift from gamifying the unboxing experience. Validates that physical packaging + digital reward drives actual purchase behavior, not just engagement.
- Nissan "Thrill Driver": A Web AR campaign where users scanned three different codes to "Unlock a Badge." Proves users will perform multi-step scans if the goal is clear.
- Burger King "Burn That Ad": Proved that gamification + rewards = viral growth. People actually searched for ads to engage with them.

7. Wireframe & User Flow

Two visuals anchor the design intent for this feature:

- App-less gamified AR interface: the AR experience plays full-screen as it does today, with a wallet icon added top-right and a slim, non-blocking quest progress bar ("Quest: 1/3 Scans — Find a Movie Poster next") appearing only after the AR completes.
- The Flam Habit Loop: Trigger (scan code) → Action (experience AR — the delight moment) → Reward (unlock stamp & points) → Investment ("1 more to win" — the next-step nudge that pulls the user back to Trigger).

Full annotated mockups for the wallet UI, quest progress states, and the reward/coupon screen are maintained as a companion artifact — see the Wireframes project — since layout is easier to evaluate visually than described in text.

7.1 Core flow

8. User scans a QR code on packaging → AR experience plays → completion event fires.
9. Stamp notification appears (post-AR, non-blocking) → wallet updates in the background.
10. User taps the wallet icon (optional) → sees quest progress and the next unlock condition.
11. User completes final stamp → coupon code generates instantly in-browser → redemption screen shown.

8. Launch Readiness

8.1 Technical feasibility

- Lightweight stack: this does not require new computer vision or heavy AI.
- Frontend: a lightweight React overlay sitting on top of the existing Web AR viewer. The stamp notification and wallet UI are new components, not replacements.
- Backend: a simple database maps User ID (phone number) to stamp state per campaign. The logic is: scan event received → check campaign rules → update stamp count → trigger reward if threshold met.
- Deployment: can be rolled out as a simple UI update on top of the existing Web AR viewer.

8.2 Phased rollout

Phase	Scope	Timeline
Pilot	Single-brand Quest campaign, solo stamps only	6–8 weeks to build
Expansion	Cross-brand campaign infrastructure (Flam-packaged partnerships)	+4 weeks on top of pilot

Cross-brand is intentionally sequenced after the single-brand pilot proves the core mechanic — see Trade-offs below.

9. Success Metrics

Metric Category	Metric Name	Definition / Target Description
North Star	Multi-brand scan rate	% of active users who scan across 2 or more different brands within a 30-day window.
Primary	Return scan rate	% of users who complete 2+ scans within 7 days of their first scan (baseline today is effectively 0%).
	Quest completion rate	% of users who reach the final stamp once they start a campaign.
Secondary	Cross-brand campaign CTR	Click-through on "next stamp" prompts.
	Brand re-enrollment rate	% of brands that run a second Quest campaign after the first.
Guardrail	AR experience completion rate	Must not drop — if the stamp UI is causing users to close before the experience ends, the overlay timing needs adjustment.

10. Trade-offs & Risks

- Reward fraud: users creating multiple phone numbers to farm stamps. Mitigation: rate-limit stamp collection per device ID, not just phone number. Flag accounts completing campaigns in under 10 minutes.
- Brand coordination complexity: cross-brand campaigns require two brands to agree on timing, reward value, and campaign window. Mitigation: launch with single-brand Quest first; cross-brand is a v2 unlock once the mechanic is proven.
- Stamp UI distracts from the AR experience: Mitigation: stamp notification triggers only after the AR experience completion event fires, never during.
